

Deploy services applications for your occupants

Create attractivity on your buildings

Occupants comfort is becoming essential for companies. It impacts directly the wellness of their employees and their productivity. Therefore a mobile application is proposed to collaborators offering various services like office comfort control, caretaking, building access, booking rooms. . . .

Those applications need to interact easily with building devices to limit the cost of their deployment.

Linkspertm interacts with every field device communicating through an opened protocol and with a large amount of proprietary protocols. It's now very simple through a mobile or Web application to control an office or a meeting room equipment because Linkspertm simplifies the synchronization of data between the field and the Cloud.

A lot of benefits

You provide lot of advantages for occupants and property assets managers:

- It's independent from the equipment brands to control
- You can handle comfort parameters for occupants
- No more remote control to maintain and to configure (especially if the building evolves frequently).
- Less consumption therefore lower operational costs.
- You can monitor space usage

Integrate your application

Linkspertm makes easy the synchronization of data between buildings data and third-party service thanks to the use of API and real time connectors. A Digital Service company can therefore deploy an application personalized to your occupant needs.

Or use a standardize application

Linkspertm proposes a generic application to control the comfort equipment. The same app is also used to commission the devices. It is simple but built automatically from the building data. It allows users to control office assets very easily.
